Screening: AF Prevalence

- Prevalence of AF in the population impacts the effectiveness of screening

Relationship between disease prevalence and predictive value in a test with 95% sensitivity and 85% specificity.

(From Mausner JS, Kramer S: Mausner and Bahn Epidemiology: An Introductory Text. Philadelphia, WB Saunders, 1985, p. 221.)

- **False Positives:** 1). Expense of monitoring 2). Exposure to risks of AOC without benefit

Mass Screening for Atrial Fibrillation in 75 Year Olds

The STROKESTOP Study

- Add ≥ 1 stroke risk factor to 75+: 7.4% have undetected AF.
- Cryptogenic Stroke: 16% reported with 30 day monitoring

- **CHA2DS2-VASc:**
 - Age, Stroke, **Female Sex**, HTN, **Vascular disease**, **HF**, **diabetes**.

- **AF Risk Scores:**
 - CHARGE: Age, **male sex**, **white race**, **weight**, **height**, **SBP**, **DBP**, **antihypertensive**, **Diabetes**, **CVD**, **MI**, **Heart Failure**
 - WHS (Women): Age, **Weight**, **Height**, **SBP**, **alcohol**, **smoking**.

Characteristics of Patients with SCAF Detected

Female sex, lower weight, and absence of vascular disease were significantly associated with no detection of AF.

CHA2DS2-VASc was not associated with AF detection
