

# Screening for AF - Larger outcome studies

**Mårten Rosenqvist**  
**Karolinska Institutet**  
**Stockholm**

# Disclosures Mårten Rosenqvist

- Research grants/lectures/ consulting
- Abbott, Bennet AB, Bayer, BMS, Medtronic, MSD, Pfizer, Roche, Zenicor

# AF screening – What do we know so far?

- Many different and feasible methods to detect AF are available
- The more we look, the more we find (1.5 % - 5% - 25%)
- High acceptance and compliance to OAC
- No obvious harm caused by screening!
- Opportunistic screening higher take-up than population screening

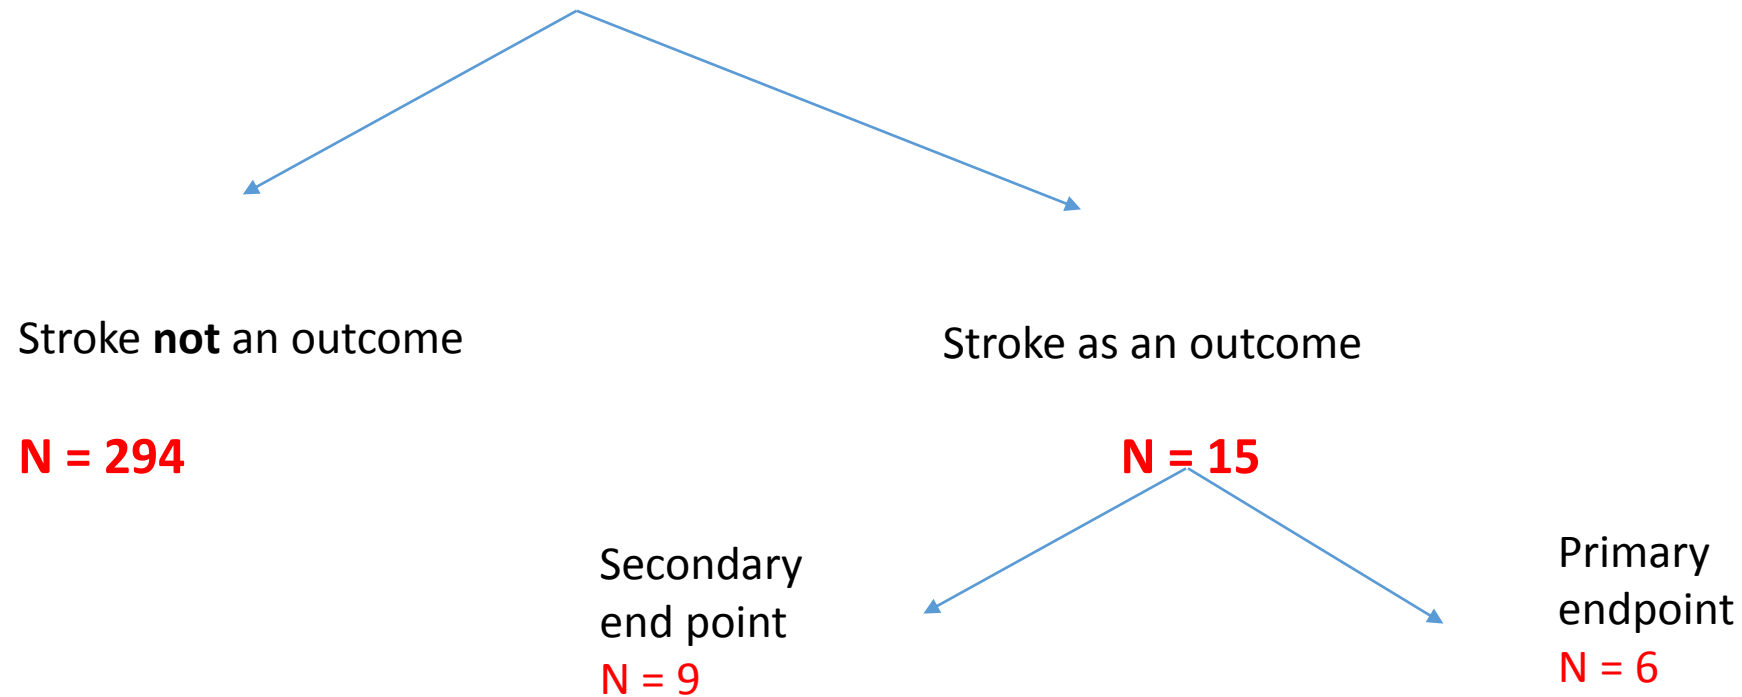

AF – screening what is it we do not know  
(but must know?)

- **Can OAC treatment of screening detected AF, in risk groups, reduce the incidence of stroke?**
- **Hard endpoints are missing!**

# Clintrial.gov

- Key words: Atrial fibrillation, screening/detection

Hits N = 309

# Studies with Stroke as secondary endpoint

N = 10

- Screen AF n= 822
- Vital AF n= 35 000
- PIAAF –FP n= 2174
- AFOSS n= 51 000
- Hong-Kong Outpatient n=500
- mSToPs n= 2224
- IDEAL n= 16000

Electronic alert 1 n= 400

Detect AF n=1600

Electronic alert 2 n= 1000

Large ( >1500) randomized outcome studies  
with stroke as secondary end-point

n = 4

- VITAL
- Rx to intensive screening vs routine
- Single ECG at office visits
- N= 35000
- Primary endpoint: Incident AF during screening
- Recruiting ( august 2018)

Large randomized outcome studies ( n > 2000), stroke as secondary endpoint

- **AFOSS**
- Observational, opportunistic vs standard care
- Pulse palpation and ECG
- N= 51000
- Primary endpoint: New diagnosis of AF
- Active, not recruiting ( July 2018)

# Large randomized outcome studies with stroke as secondary endpoint

- **mSTOPs**
- Randomized early versus late monitoring
- Patch sensor
- n = 2224
- Active, not recruiting ( July 2018)
- Primary end-point: New diagnosis of AF

# Large outcomes studies with stroke as secondary end-point

- **Ideal MD**
- Randomized opportunistic vs standard
- Single ECG
- N = 16 000
- Primary end-point: Newly detected AF
- Completed ( july 2018)

# AF screening with stroke as a primary outcome N = 6

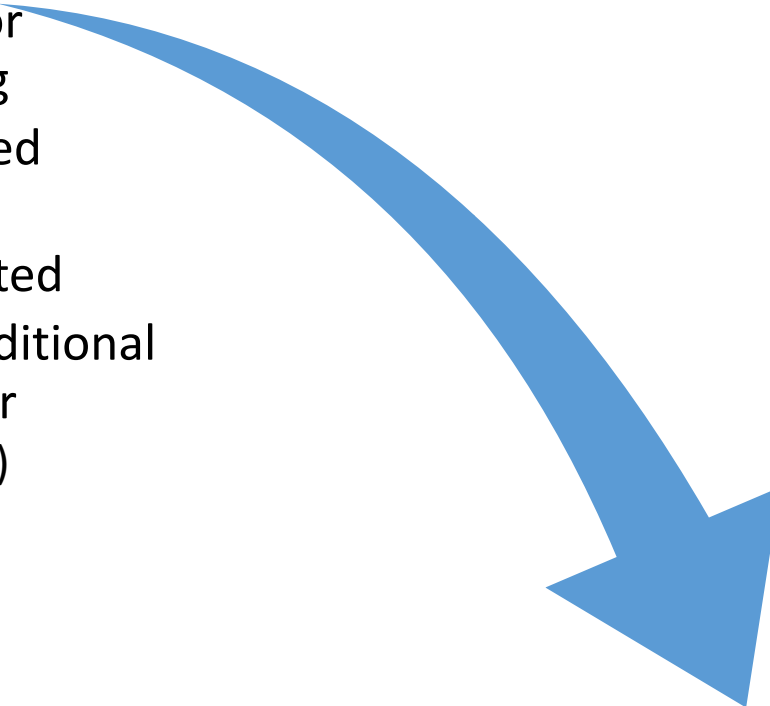

- Strokestop Pilot Published Europace 2018
- Strokestop 1 Recruitment completed, awaiting follow-up
- Strokestop 2 Recruitment completed, awaiting follow-up
- Danish Loop Study Recruitment completed, awaiting follow up
- Safer Planning phase
- Detection AF Not yet recruiting

# STROKESTOP pilot study

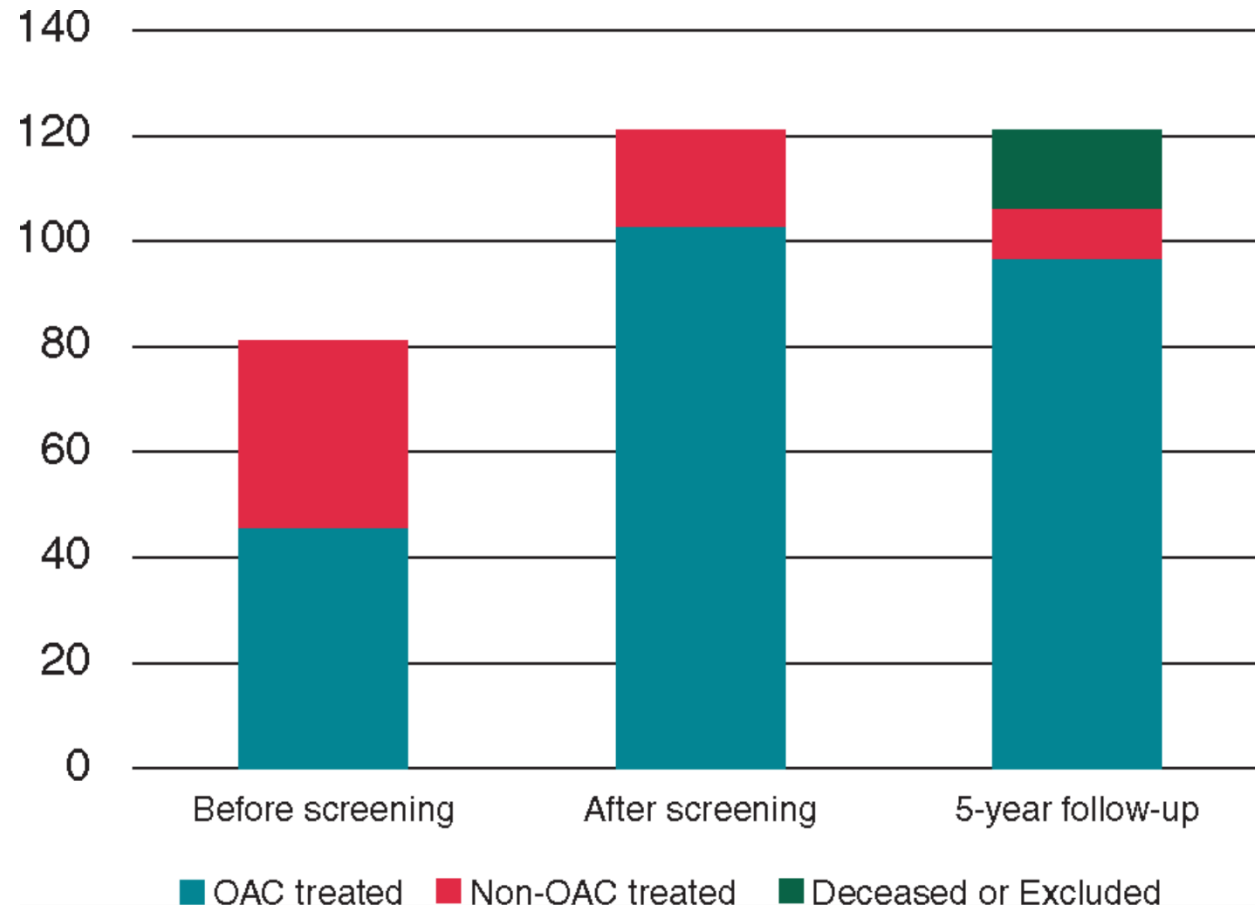

## Halmstadproject

- All 75-76 yrs invited for screening
- 948 invited
- 65% participated
- If one additional risk factor (CHADS2)

8% AF and candidates for OAC treatment

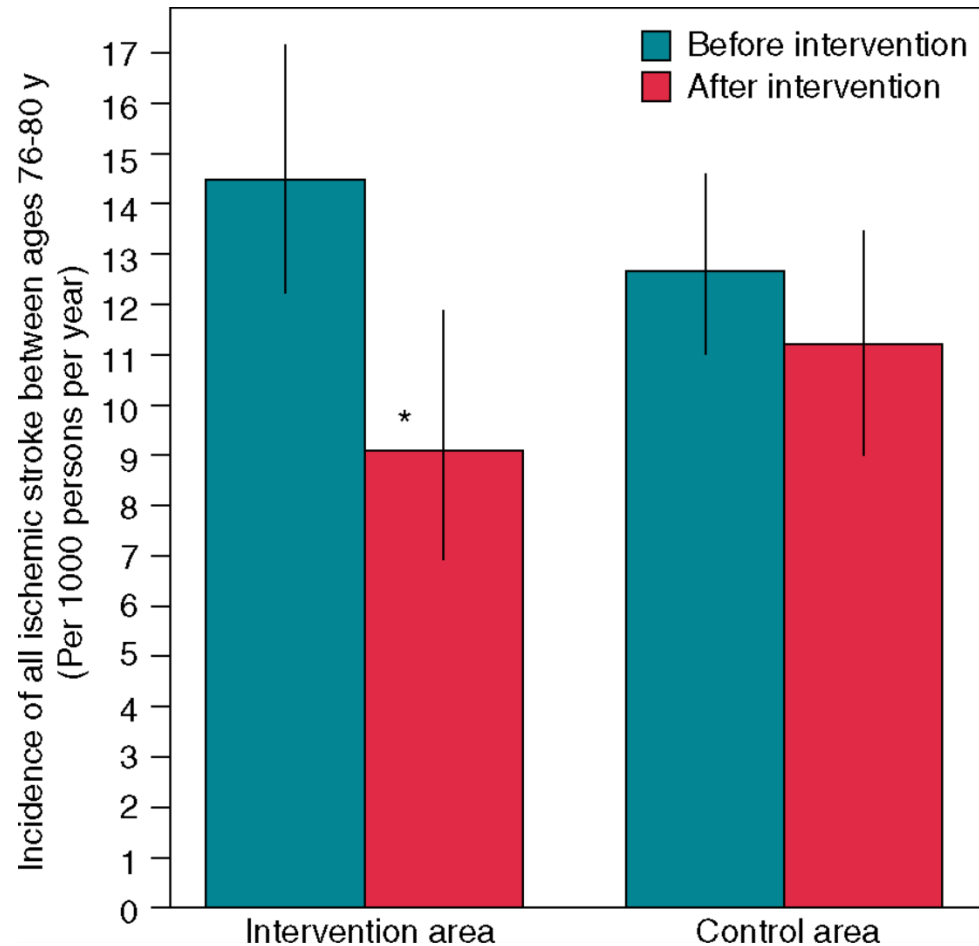

intermittent ECG  
14 days 30 sec x 2  
(Engdahl et al Circulation 2013)

# “STROKESTOP I” study

- 28 757 individuals 75-76 yrs randomised for AF screening or no intervention
- Resting ECG and history
- If SR, Hand-held ECG 14 days, 2 x 30 sec.
- When AF is detected: Treatment with OAC

(Svennberg et al Circulation 2015)

# Prespecified Interim analysis January 2018

1. Initiation of OAC – No safety problems.
2. Continued follow-up until all patients been followed for 5 years (2019)

# STROKESTOP II - Background

ESC guidelines 2016

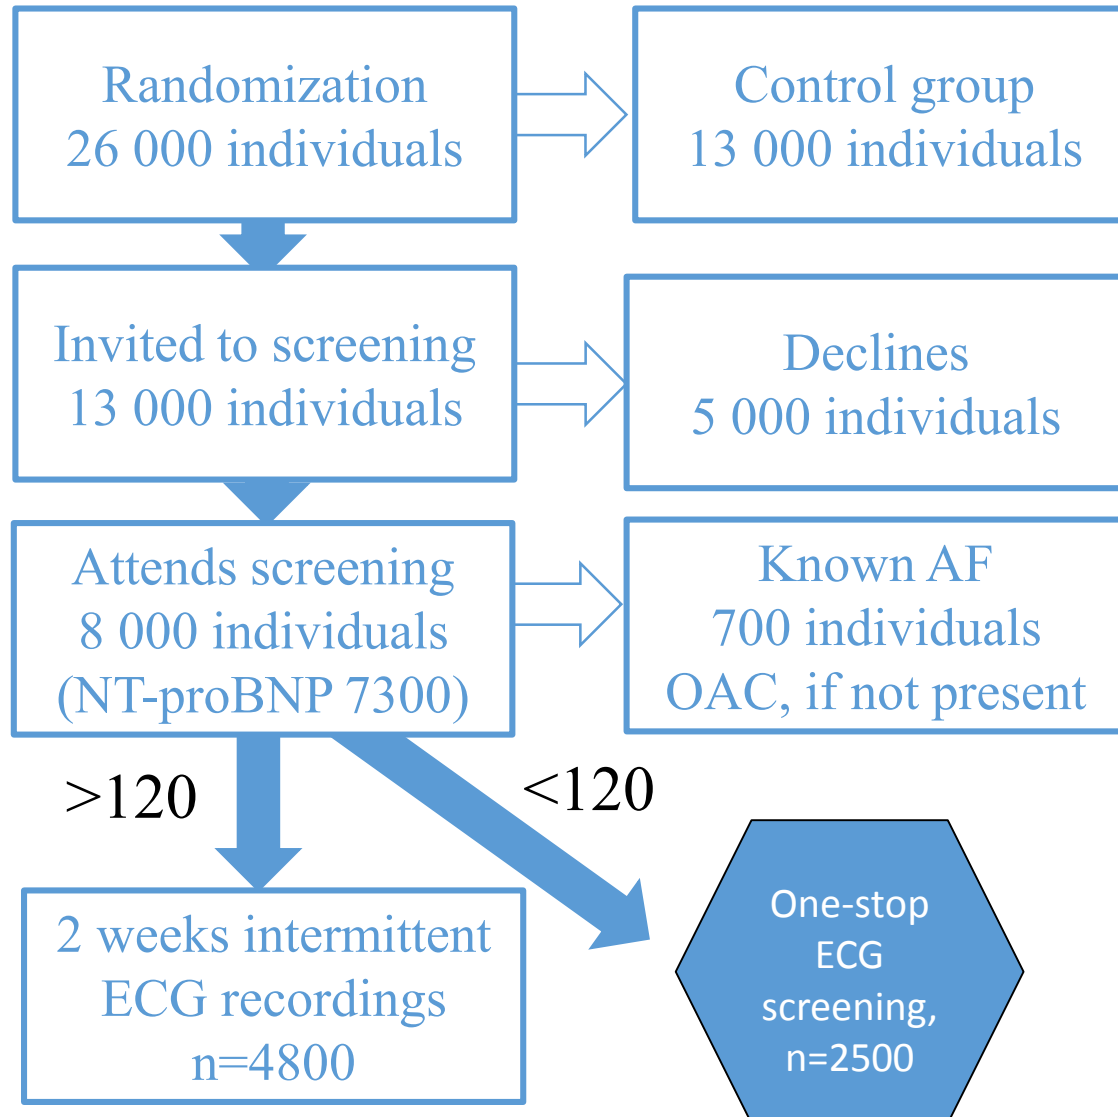

(Svennberg Circulation 2015)

**Aim:** To study the yield of AF screening in a high risk population with NT-proBNP enrichment

# Method

**Karolinska  
Institutet**

8686 patients included for screening.

Data to be presented  
Sunday August 26, 12:03

Agora 2

5 year follow 2023

# The Danish Loop study ( as of June 14, 2018)

- Inclusion : At least 70 years and DM/HT/CHF/ stroke
- Rx 1:3 Loop recorder vs control (1500 ILR vs 4500 controls)
- At least 3 years of follow-up
- AF defined as continuous AF for at least 6 minutes
- If AF , OAC is started
- F-Up until March 2019
- Primary end-point: Stroke + peripheral emboli
- Inclusion completed May 2016

# Large randomized studies with stroke as primary end-point

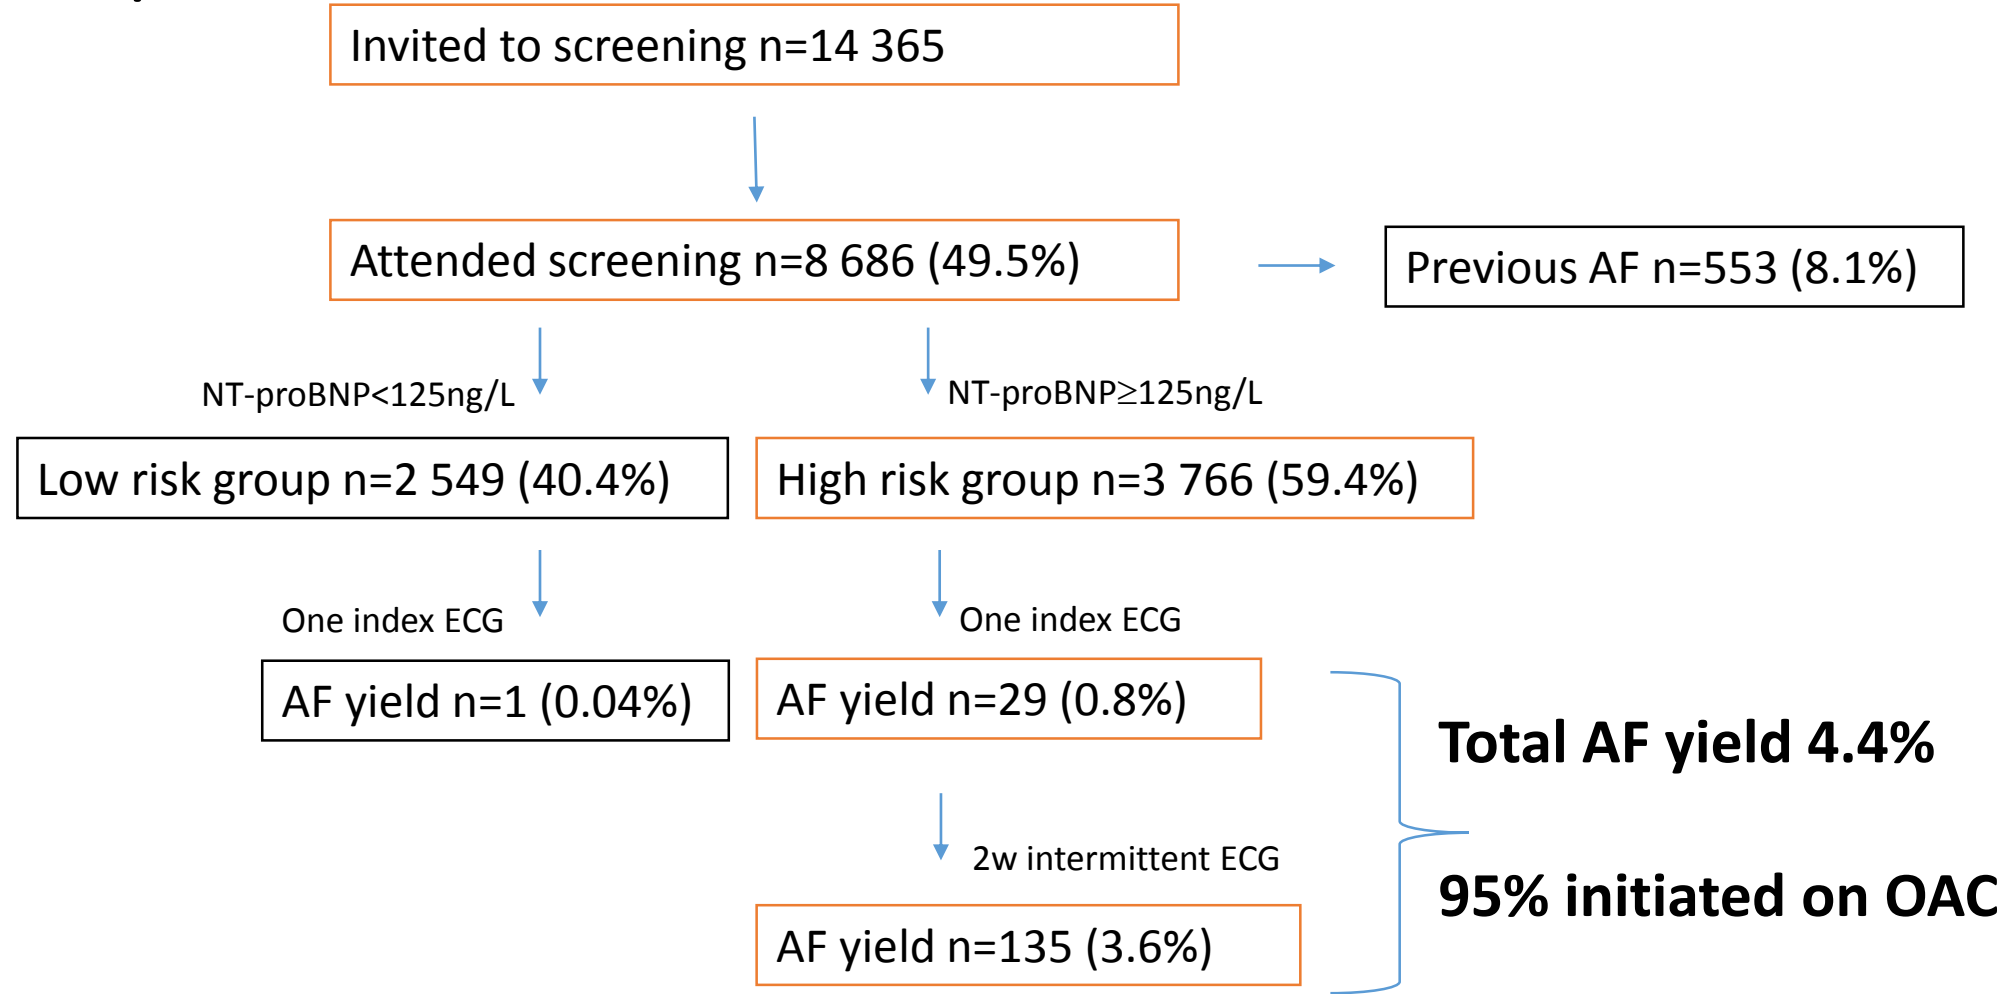

- **Detection AF**
- Rx screening vs screening
- In-hospital risk patients
- Intermittent ECG
- N = 1600
- Five year follow-up
- Not recruiting ( as june 2017)

# The Safer Study

# Conclusion

- Outcome studies with stroke as primary endpoint are urgently needed to verify whether AF screening is a cost-effective method to decrease the incidence of stroke

# Methods/Results

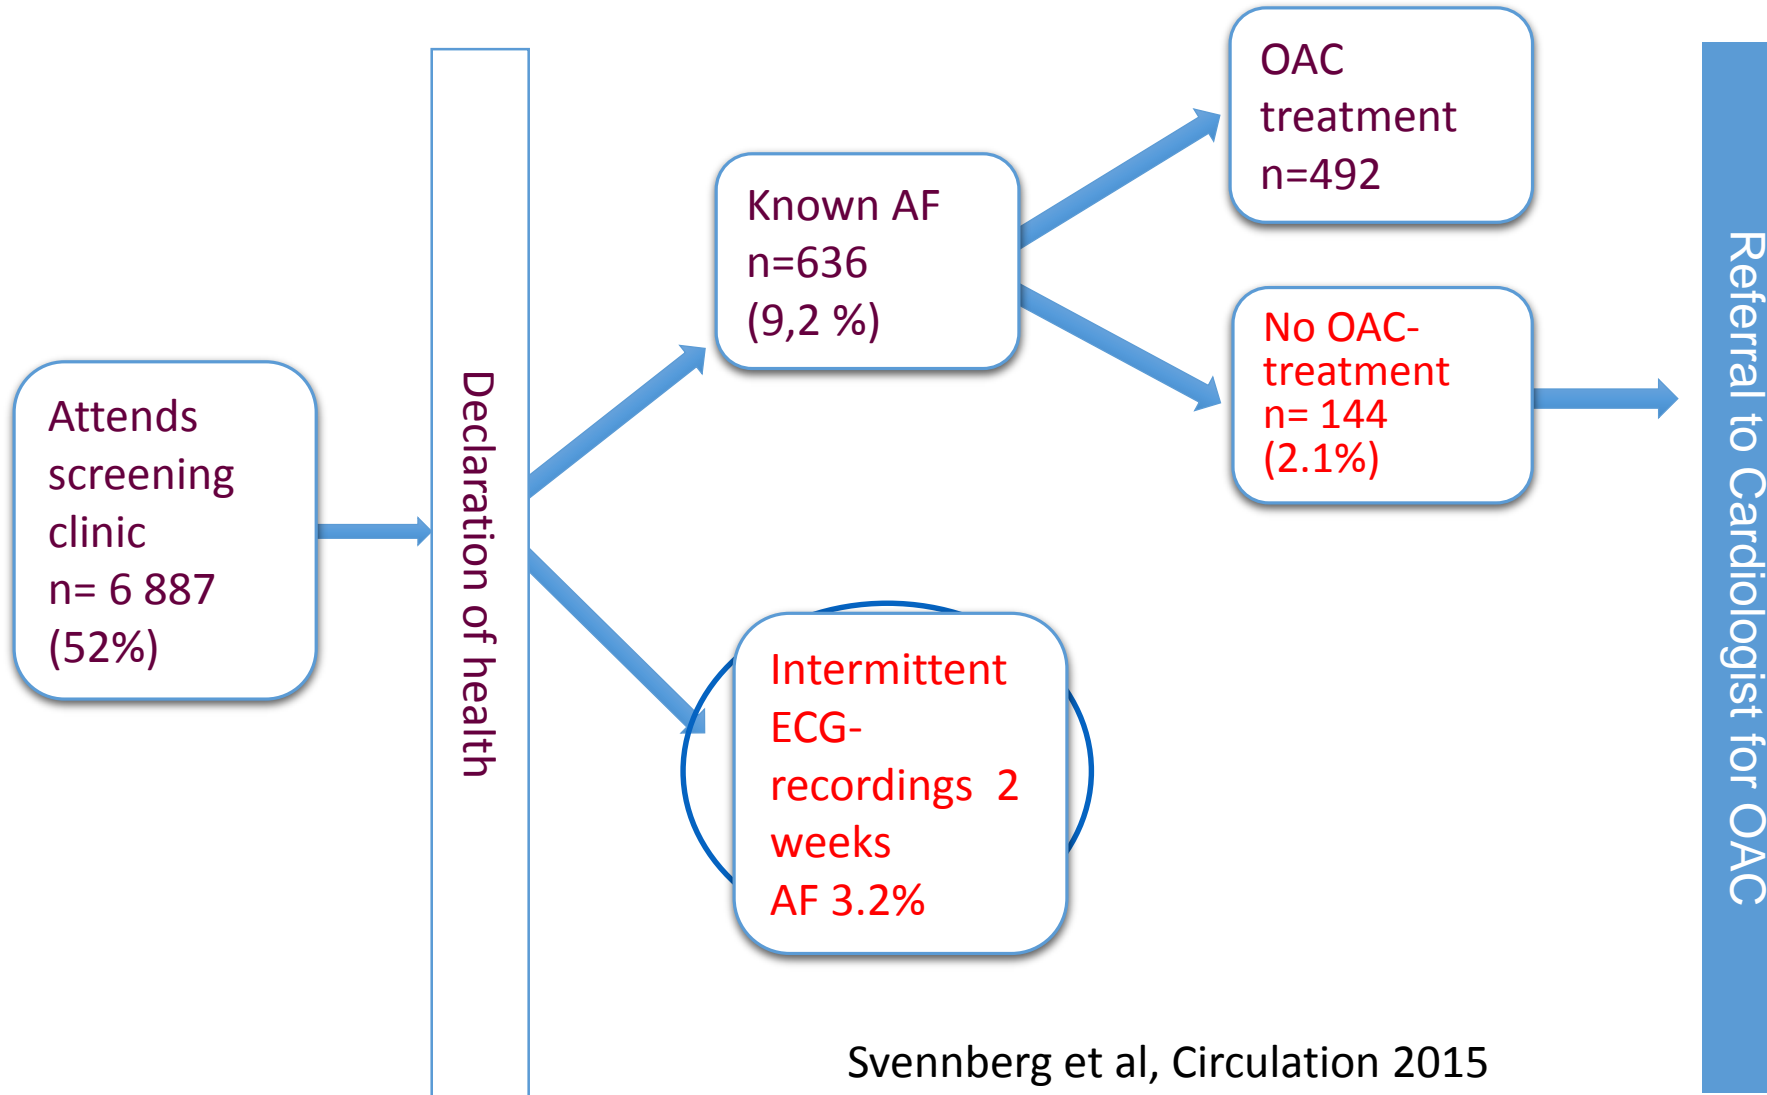

# Results

Karolinska  
Institutet

# Halmstad project

## Results

Known AF – No OAC treatment	3 %
Resting ECG – New AF	1%
Intermittent ECG – New AF	4 %

**Totally, 8% candidates for oral anticoagulation treatment**
